1.1 Summary of test results

Standard Test result 47 CFR Part 15, Passed sections 15.207 and 15.209 RSS-210 Issue 8 clause 2 Passed (with appropriate references to RSS-Gen Issue 4)

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

2 Equipment under Test (EUT)

Product type: Torque meter

Model Name: T40S7

T40S8 T40S9

Manufacturer: Hottinger Baldwin Messtechnik GmbH

Serial number: T40S7: 181312019

T40S8: 183370027

T40S9: 141630023

FCC ID: 2ADAT-T40S7TOS9
IC certification number: 12438A-T40S7TOS9

Application frequency band: Not applicable (general requirements apply)

Frequency range: 522.85 kHz -> wireless power supply

1.22 MHz -> wireless data transfer

Operating frequency: 522.85 kHz -> wireless power supply

1.22 MHz -> wireless data transfer

Number of RF-channels: 2

Modulation: ASK -> wireless power supply

PSK -> wireless data transfer

Antenna types: loop antenna

 \square detachable \boxtimes not detachable

Power supply: External power source

nominal: 24.0 VDC

Temperature range: -20°C to +85°C

Remark:

The tests were performed with 120V AC / 60Hz at mains input of DC power supply.

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

2.1 Photo documentation

For photos of the EUT, see annex B. For photos taken during testing, see annex A.

2.2 Short description of the EUT

The EUT is a torque meter with wireless measurement data transfer and wireless power supply. The measurement data transfer goes from rotor to stator. The wireless power supply goes the other way round. In the field EUT is part of an engine test bench.

2.3 Operation mode

The EUT is configured to start wireless power supply, measurement and data transfer as soon as supplied by external power.

The position in which the EUT was tested is documented in annex A.

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

2.4 Configuration

The following peripheral devices and interface cables were connected during the tests:

Device	Model:	Serial or inventory number
Torque meter	T40S7	181312019
Torque meter	T40S8	183370027
Torque meter	T40S9	141630023
DC power supply	TRIO-PS/1AC/24DC/5 120 VAC / 60 Hz -> 24 VDC	3013539322
Data cable termination box	hbm test device (for radiated measurements)	n/a
AC power source	CHROMA 61602	616020002099

2.5 Used cables

Numbers:	Description: (type / lengths / remarks)	Serial No	
1	7-pin shielded cable with 2 screw connectors, 3 m (for radiated measurements)	n/a	
1	7-pin shielded cable with 1 screw connector and DC plug, 3 m (for AC power line conducted emissions)	n/a	

3 AC power line conducted emissions

according to 47 CFR Part 15, section 15.207, and RSS-210, section 2.1 with RSS-Gen, section 8.8

3.1 Test location

Description	Manufacturer	Inventory No.
Shielded room	Siemens - Matsushita	E00107

3.2 Test instruments

	Description Manufacturer		Inventory No.
\boxtimes	ESCS 30	Rohde & Schwarz	E00003
	□ ESU 26 Rohde & Schwarz		W00002
	ESCI	Rohde & Schwarz	E00001
	ESH3-Z2	Rohde & Schwarz	E00028
\boxtimes	ESH2-Z5	Rohde & Schwarz	E00004
	ESH2-Z5	Rohde & Schwarz	E00005

3.3 Limits

Frequency [MHz]	Quasi-peak [dBµV]	Avarage [dΒμV]
0.15 – 0.5	66 – 56	56 – 46
0.5 - 5.0	56	46
5 – 30	60	50

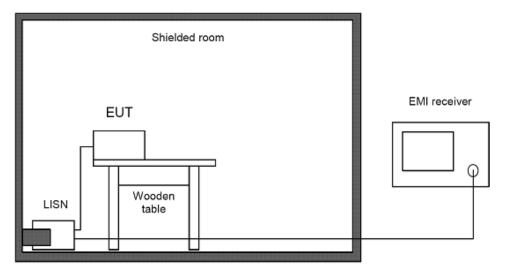

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

3.4 Test procedure

- The tests of conducted emission were carried out in a shielded room using a line impedance stabilization network (LISN) 50 μH/50 Ohms and an EMI test receiver.
- 2. The EMI test receiver was connected to the LISN and set to a measurement bandwidth of 9 kHz in the frequency range from 0.15 MHz to 30 MHz.
- 3. The EUT was placed on a wooden table and connected to the LISN.
- 4. To accelerate the measurement the detector of the EMI test receiver was set to peak and the whole frequency range form 0.15 MHz to 30 MHz was scanned.
- 5. After that all peaks values with less margin than 10 dB to quasi-peak limit or exceeding the limit were marked and re-measured with quasi-peak detector.
- 6. If after that all values are under the average limit no addition measurement is necessary. In case there are still values between quasi-peak and average limit then these values were re-measured with average detector.
- 7. These measurements were done on all power lines.

According to ANSI C63.4, section 13.3.1 testing of intentional radiators with detachable antennas shall be done with a dummy load otherwise the tests should be done with connected antenna and if adjustable fully extended.

3.5 Test setup

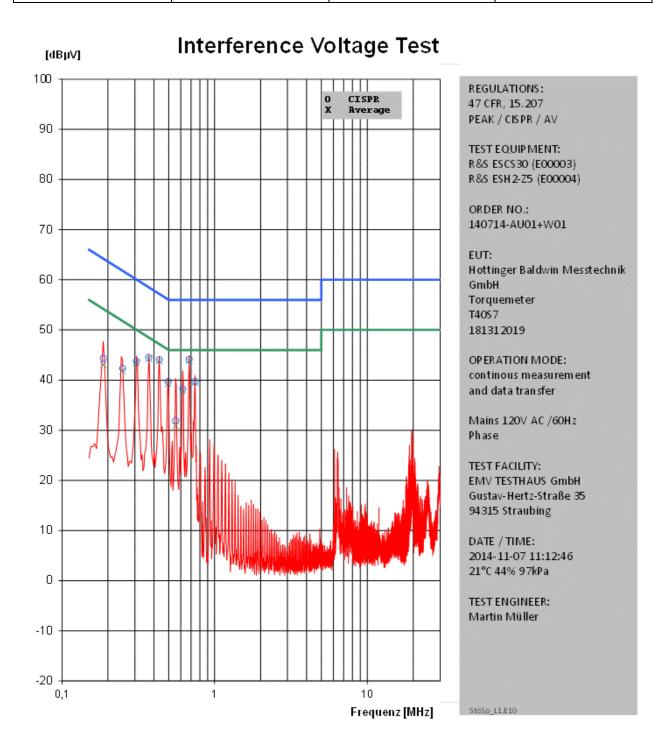

Picture 1: Outline of conducted emission test setup

Comments: All peripheral devices were additionally decoupled by means of a line stabilization network.

4.3 Limits

The field strength of any emissions including spurious emissions falling into restricted bands as specified in 15.205(a) shall not exceed the general radiated emission limits as specified in 15.209.

Frequency [MHz]	Field strength Fs [μV/m]	Field strength [dBµV/m]	Measurement distance d [m]
0.009 - 0.490	266.6 – 4.9	48.5 – 13.8	300
0.490 - 1.705	48.98 – 14.08	33.8 – 22.97	30

30 – 88	100	40	3
88 – 216	150	43.5	3
216 - 960	200	46	3
Above 960	500	54	3

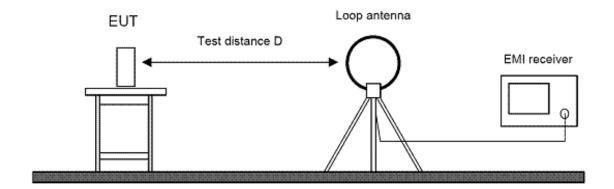

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

4.4 Test procedure

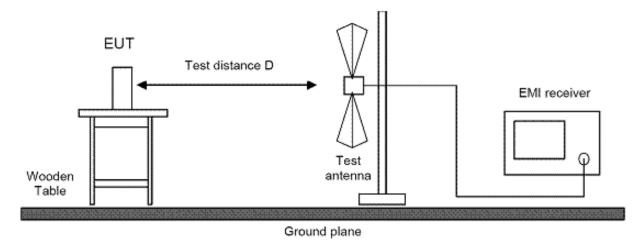

- 1. EUT was configured according to ANSI C63.4. It was placed on the top of the turntable 0.8 meter above ground. The receiving antenna was placed 3 meters from the turntable. The test setup was placed inside a compact diagnostic chamber.
- 2. EUT and all peripherals were powered on.
- 3. The broadband antenna was set to vertical polarization.
- 4. The EMI receiver performed a scan from 30 MHz to 1000 MHz with peak detector peak and measurement bandwidth set to 120 kHz.
- 5. The turn table was rotated to 6 different positions (360° / 6) and the antenna polarization was changed to horizontal.
- 6. Test procedure at step 4 and 5 was repeated.
- 7. The test setup was then placed in an OATS at 3 m distance and all peak values over or with less margin to the limit than 6dB were marked and re-measured with a quasi-peak detector.
- 8. The turntable was rotated by 360 degrees to determine the position of the highest radiation.
- 9. The height of the broadband receiving antenna was varied between one meter and four meters above ground to find the maximum emission field strength of both horizontal and vertical polarization. The highest value was recorded.
- 10. For emissions below 30 MHz measurements were done using a loop antenna. Prescans were performed with peak detector and final measurements with quasi-peak except for the frequency bands 9 to 90 kHz and 110 to 490 k Hz where average detector applies. Antenna height was not changed during this test. Appropriate CISPR bandwidths of 200 Hz for frequencies up to 150 kHz and 9 or 10 kHz for frequencies above were used.

4.5 Test setup

Picture 14: Test setup for radiated emission measurement (< 30 MHz)

Picture 15: Test setup for radiated emission measurement (< 1 GHz)

4.6 Test deviation

There is no deviation from the standards referred to.

Radiated Emission Measurement 9 kHz - 30 MHz

Test procedure

The EUT was placed in a full anechoic chamber and the spurious emission testing was performed in accordance with ANSI C63.4, and 47 CFR Part 15, Subpart C. The measurement distance was 3 m.

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

Restricted Band (2.1735 MHz - 2.1905 MHz)

Remark:

This measurement was performed using magnetic field probe RF-R 400-1 to show that there are no emissions caused by carrier or modulation. During the "radiated emission 9kHz - 30MHz"-measurement no carrier at 1.22 MHz was detected because of its low amplitude. The setup is documented in Annex A.

5 Radiated emission measurement (>1 GHz)

according to 47 CFR Part 15, section 15.209(a), RSS-210, section 2.5 with RSS-Gen, section 8.9

Remark:

This measurement needs not to be applied because

- the intentional radiator operates below 10 GHz and tenth harmonic of the highest fundamental frequency is lower than 1 GHz (see 47 CFR Part 15, section 15.33(a)(1), and RSS-Gen, section 6.13), and
- the digital part of the device does not generate or use internal frequencies higher than 108 MHz (see 47 CFR Part 15 section 15.33(b)(1), and RSS-Gen, section 2.3.3 with ICES-003, section 6.2).

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

6 Bandwidths

according to CFR 47 Part 2, section 2.202(a), and RSS-Gen, section 6.6

6.1 Test Location

See clause 4.1 on page 25.

6.2 Test instruments

See clause 0 on page 25.

6.3 Limits

The bandwidths are recorded only. There are no limits specified in CFR 47 Part 15, section 15.209, and RSS-210, Annex 2.6

6.4 Test setup

See clause 4.5 on page 28.

6.5 Test deviation

There is no deviation from the standards referred to.

Temperature:	18°C	Humidity:	47%
Tested by:	Martin Müller	Test date:	2014-11-11

Occupied bandwidth (99 %)

Test procedure

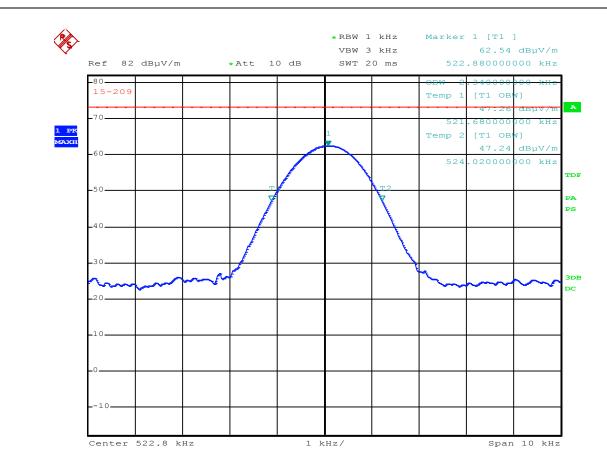

When an occupied bandwidth value is not specified in the applicable RSS, the transmitted signal bandwidth to be reported is to be its 99% emission bandwidth, as calculated or measured. The transmitter shall be operated at its maximum carrier power measured under normal test conditions.

The span of the analyzer shall be set to capture all products of the modulation process, including the emission skirts. The resolution bandwidth shall be set to as close to 1% of the selected span as is possible without being below 1%. The video bandwidth shall be set to 3 times the resolution bandwidth. Video averaging is not permitted. Where practical, a sampling detector shall be used given that a peak or peak hold may produce a wider bandwidth than actual.

The trace data points are recovered and directly summed in linear terms. The recovered amplitude data points, beginning at the lowest frequency, are placed in a running sum until 0.5% of the total is reached and that frequency recorded. The process is repeated for the highest frequency data points. This frequency is recorded. The span between the two recorded frequencies is the occupied bandwidth. For this purpose the appropriate measurement function of the spectrum analyzer is used.

Measured occupied bandwidth (99 %) - 522 kHz: 2.3400 kHz

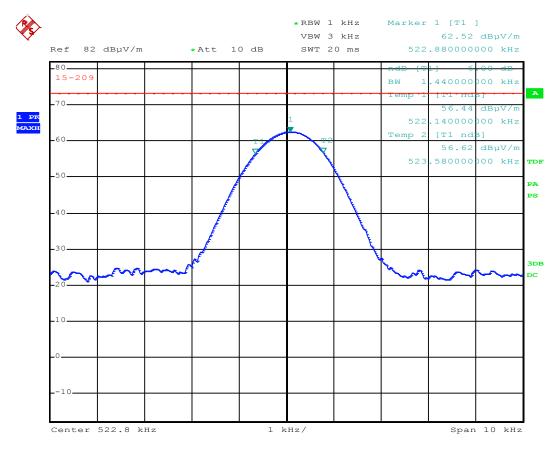

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

-6 dB emission bandwidth

Test procedure

Where indicated, the -6 dB emission bandwidth is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated 6 dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth equal to approximately 1.0% of the emission bandwidth

Picture 38: T40S7 - -6 dB emission bandwidth - 522 kHz

Measured -6 dB emission bandwidth - 522 kHz: 1.4400 kHz

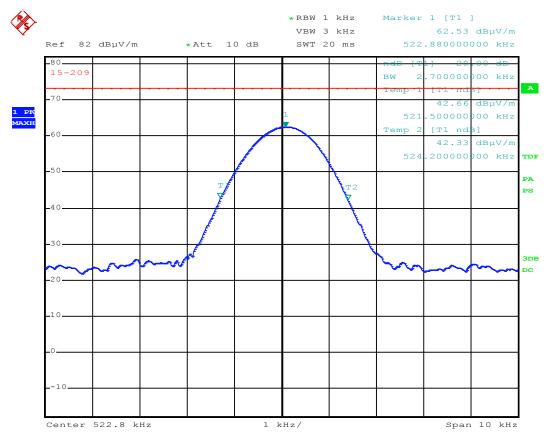

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

-20 dB emission bandwidth

Test procedure

Where indicated, the -20 dB emission bandwidth is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated 20 dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth equal to approximately 1.0% of the emission bandwidth.

-6 dB emission bandwidth

Test procedure

Where indicated, the -6 dB emission bandwidth is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated 6 dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth equal to approximately 1.0% of the emission bandwidth

Picture 44: T40S9 - -6 dB emission bandwidth - 522 kHz

Measured -6 dB emission bandwidth - 522 kHz: 1.4400 kHz

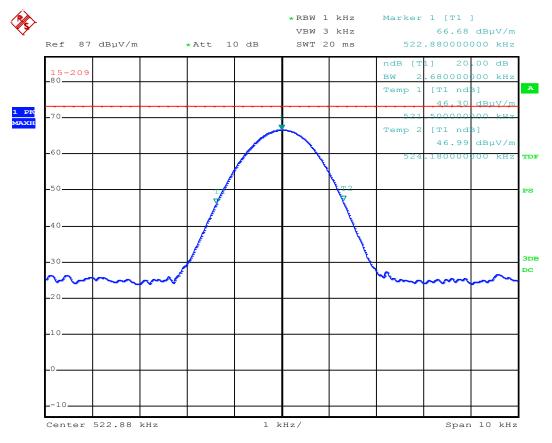

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

-20 dB emission bandwidth

Test procedure

Where indicated, the -20 dB emission bandwidth is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated 20 dB below the maximum in-band spectral density of the modulated signal. Spectral density (power per unit bandwidth) is to be measured with a detector of resolution bandwidth equal to approximately 1.0% of the emission bandwidth.

Picture 45: T40S9 - -20 dB emission bandwidth - 522 kHz

Measured -20 dB emission bandwidth - 522 kHz: 2.6800 kHz

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

6.9 Necessary bandwidth - data transfer carrier (1.22 MHz)

Test procedure

Calculated according to TRC-43, Issue 3, November 2012

Formula for PSK: $B_n = \frac{2 \times R \times K}{log_2 S}$

 $R = 1.2 \text{ Mbps}^{-1}$

K = 1

S = 3

 $B_n = 1.5142 \text{ MHz}$

Note¹⁾: customer information

Remark: The calculation of the data transfer carrier is valid for all the models because the parameters

are the same. Due to extremely low levels the bandwidth cannot be verified by

measurements of e. g. occupied bandwidth..

7 Equipment calibration status

8 Measurement uncertainty

Description	Max. deviation	k=
Conducted emission AMN (9kHz to 30 MHz)	± 3.8 dB	2
Radiated emission open field (3 m) (30 MHz to 300 MHz) (300MHz to 1 GHz)	± 5.4 dB ± 5.9 dB	2
Radiated emission absorber chamber (> 1000 MHz)	± 4.5 dB	2

Table 2: Measurement uncertainty

The uncertainty stated is the expanded uncertainty obtained by multiplying the standard uncertainty by the coverage factor k. For a confidence level of 95 % the coverage factor k is 2.

EMV TESTHAUS GmbH Gustav-Hertz-Straße 35 94315 Straubing Germany Revision: 1.0

9 Summary

The EMC Regulations according to the marked specifications are

☑ KEPT

The EUT does fulfill the general approval requirements mentioned.

□ NOT KEPT

The EUT does not fulfill the general approval requirements mentioned.
